Experiment 2: Introduction to SIEM

Objective

To gain a working understanding of Security Information and Event Management (SIEM) — how logs and events are collected, correlated, and investigated — using the Introduction to SIEM room on TryHackMe.

Steps Followed

1. Logged into TryHackMe and launched the Introduction to SIEM room.
2. Reviewed the underlying concepts of SIEM platforms, log sources, event types, and continuous security monitoring.
3. Used the SIEM interface provided in the room to inspect sample log data.
4. Answered the embedded questions for each task.
5. Verified each answer and progressed through the room to completion.

Key Learnings

Working through the room clarified the difference between host-centric activity (such as registry changes) and network-centric activity (such as VPN connections), where common log types are stored on Linux systems, how alerts can be triaged as true or false positives, and how a suspicious process (a coin-miner in this case) can be traced back to the responsible user and host through log correlation.

Outcome

The Introduction to SIEM room was completed in full. The exercise reinforced practical skills in log analysis, event monitoring, and identifying genuine security incidents versus noise.
